

1. Prove the Gauss-Markov Theorem, i.e. show that the least squares estimate in linear regression is the BLUE (Best Linear Unbiased Estimate), which means $\text{Var}(\mathbf{a}^T \hat{\beta}) \leq \text{Var}(\mathbf{c}^T \mathbf{y})$ where $\mathbf{c}^T \mathbf{y}$ is any unbiased estimator for $\mathbf{a}^T \beta$. (20 pts)

$$\text{Proof: } \because \mathbf{y} = \mathbf{X}\beta + \varepsilon$$

$$\begin{aligned} \therefore \hat{\beta} &= (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y} \\ &= (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T (\mathbf{X}\beta + \varepsilon) \\ &= (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{X} \beta + (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon \\ &= \beta + (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon \\ \therefore E[\hat{\beta}] &= E[\beta + (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon] \\ &= E[\beta] + E[(\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon] \\ &= E[\beta] + E[(\mathbf{X}^T \mathbf{X})^{-1}] \cdot E[\varepsilon] \\ &= E[\beta] \quad (\because E[\varepsilon] = 0) \end{aligned}$$

$\therefore \hat{\beta}$ is unbiased — ①

$$\begin{aligned} \therefore \text{Var}(\mathbf{a}^T \hat{\beta}) &= \text{Var}(\mathbf{a}^T (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon) \\ &= \mathbf{a}^T E[((\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon)((\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon)^T] \mathbf{a} \\ &= \mathbf{a}^T E[(\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \varepsilon \varepsilon^T X ((\mathbf{X}^T \mathbf{X})^{-1})^T] \mathbf{a} \\ &= \mathbf{a}^T (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T (\sigma^2 I) X (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{a} \\ &= \sigma^2 \mathbf{a}^T (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{a} \quad — ② \end{aligned}$$

$$\begin{aligned} \therefore \mathbf{c}^T \mathbf{y} &= \mathbf{c}^T (\mathbf{X}\beta + \varepsilon) \\ &= \mathbf{c}^T \mathbf{X}\beta + \mathbf{c}^T \varepsilon \end{aligned}$$

$$\begin{aligned} \therefore \text{Var}(\mathbf{c}^T \mathbf{y}) &= \text{Var}(\mathbf{c}^T \mathbf{X}\beta + \mathbf{c}^T \varepsilon) \\ &= \text{Var}(\mathbf{c}^T \varepsilon) \\ &= \mathbf{c}^T \text{Var}(\varepsilon) \mathbf{c} \\ &= \mathbf{c}^T (\sigma^2 I) \mathbf{c} \\ &= \sigma^2 \mathbf{c}^T \mathbf{c} \quad — ③ \end{aligned}$$

$\therefore \mathbf{c}^T \mathbf{y}$ is unbiased estimator for $\mathbf{a}^T \beta$

$$\therefore E[\mathbf{c}^T \mathbf{y}] = E[\mathbf{a}^T \hat{\beta}]$$

$$\begin{aligned} \therefore E[\mathbf{c}^T \mathbf{y}] &= \mathbf{c}^T E[\mathbf{y}] = \mathbf{c}^T E[\mathbf{X}\beta + \varepsilon] = \mathbf{c}^T \mathbf{X}\beta \\ E[\mathbf{a}^T \hat{\beta}] &= \mathbf{a}^T E[\hat{\beta}] = \mathbf{a}^T \beta \quad (\text{from ①}) \end{aligned}$$

$$\therefore \mathbf{c}^T \mathbf{X}\beta = \mathbf{a}^T \beta$$

$$\therefore \mathbf{c} = (\mathbf{X}^T)^{-1} \mathbf{a}$$

$$\begin{aligned} \therefore \text{Var}(\mathbf{c}^T \mathbf{y}) &= \sigma^2 \mathbf{c}^T \mathbf{c} \\ &= \sigma^2 ((\mathbf{X}^T)^{-1} \mathbf{a})^T (\mathbf{X}^T)^{-1} \mathbf{a} \\ &= \sigma^2 \mathbf{a}^T (\mathbf{X}^T)^{-1} (\mathbf{X}^T)^T \mathbf{a} \end{aligned}$$

$$\therefore \mathbf{a}^T (\mathbf{X}^T)^{-1} (\mathbf{X}^T)^T \mathbf{a} \geq \mathbf{a}^T (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{a} \quad (\because \text{Cauchy-Schwarz})$$

$$\therefore \text{Var}(\mathbf{c}^T \mathbf{y}) \geq \text{Var}(\mathbf{a}^T \hat{\beta}) \quad (\text{from ②, ③})$$

RID

2. (Linear Regression with Orthogonal Design) Assume that the columns $\mathbf{x}_0, \dots, \mathbf{x}_p$ of \mathbf{X} are orthogonal. Express $\hat{\beta}_j$ in terms of $\mathbf{x}_0, \mathbf{x}_1, \dots, \mathbf{x}_p$ and \mathbf{y} . (10 pts)

$\therefore \mathbf{x}_0, \dots, \mathbf{x}_p$ are orthogonal

$$\therefore \mathbf{x}_i \cdot \mathbf{x}_j = \begin{cases} \|\mathbf{x}_i\|^2, & i=j \\ 0, & i \neq j \end{cases}$$

$$\therefore \mathbf{X}^T \mathbf{X} = \text{diag}(\|\mathbf{x}_0\|^2, \|\mathbf{x}_1\|^2, \dots, \|\mathbf{x}_p\|^2)$$

$$\therefore (\mathbf{X}^T \mathbf{X})^{-1} = \text{diag}\left(\frac{1}{\|\mathbf{x}_0\|^2}, \frac{1}{\|\mathbf{x}_1\|^2}, \dots, \frac{1}{\|\mathbf{x}_p\|^2}\right)$$

$$\therefore \hat{\beta} = (\mathbf{X}^T \mathbf{X})^{-1} \mathbf{X}^T \mathbf{y}$$

$$\therefore \hat{\beta}_j = \frac{\mathbf{x}_j^T \mathbf{y}}{\|\mathbf{x}_j\|^2}, \quad j=0, 1, \dots, p$$

3. (The Minimum Norm Solution) When $\mathbf{X}^T \mathbf{X}$ is not invertible, the normal equations $\mathbf{X}^T \mathbf{X} \beta = \mathbf{X}^T \mathbf{y}$ do not have a unique solution. Assume that $\mathbf{X} \in \mathbb{R}_r^{n \times (p+1)}$, where r is the rank of \mathbf{X} . Assume that the SVD of \mathbf{X} is $\mathbf{U} \Sigma \mathbf{V}^T$, where $\mathbf{U} \in \mathbb{R}^{n \times r}$ satisfies $\mathbf{U}^T \mathbf{U} = \mathbf{I}_r$. Also $\mathbf{V} \in \mathbb{R}^{(p+1) \times r}$ satisfies $\mathbf{V}^T \mathbf{V} = \mathbf{I}_r$ and $\Sigma = \text{diag}(\sigma_1, \dots, \sigma_r)$ is the diagonal matrix of positive singular values.

- (a) Show that $\beta_{\text{mns}} = \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{y}$ is a solution to the normal equations. (5 pts)
- (b) Show that for any other solution β to the normal equations, $\|\beta\| \geq \|\beta_{\text{mns}}\|$. [Hint: one way (and not the only way) of doing this is to show that $\beta = \beta_{\text{mns}} + b$.] (15 pts)
- (c) Is $\mathbf{V} \Sigma^{-1} \mathbf{U}^T$ the pseudo-inverse of \mathbf{X} ? (Hint: you can prove or disprove using the so-called Penrose properties) (10 pts)

$$\begin{aligned}
 (\text{a}) \text{ Proof: } \mathbf{X}^T \mathbf{X} \beta_{\text{mns}} &= \mathbf{X}^T \mathbf{X} \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{y} \\
 &= (\mathbf{U} \Sigma \mathbf{V}^T)^T (\mathbf{U} \Sigma \mathbf{V}^T) \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{y} \\
 &= \mathbf{V} \Sigma^T \mathbf{U}^T \mathbf{U} \Sigma \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{y} \\
 &= \mathbf{V} \Sigma^T \underbrace{\mathbf{I}_r}_{\Sigma} \underbrace{\Sigma^{-1}}_{\Sigma} \mathbf{U}^T \mathbf{y} \\
 &= \mathbf{V} \Sigma^T \mathbf{I}_r \mathbf{U}^T \mathbf{y} \\
 &= (\mathbf{U} \Sigma \mathbf{V}^T)^T \mathbf{y} \\
 &= \mathbf{X}^T \mathbf{y}
 \end{aligned}$$

$\therefore \beta_{\text{mns}}$ is a solution to the normal equations

(b) Suppose $\beta = \beta_{\text{mns}} + b$, both β and β_{mns} are solutions of equations

$$\therefore \mathbf{X}^T \mathbf{y} = \mathbf{X}^T \mathbf{X} \beta = \mathbf{X}^T \mathbf{X} \beta_{\text{mns}}$$

$$\therefore \mathbf{X}^T \mathbf{X} (\beta - \beta_{\text{mns}}) = \mathbf{X}^T \mathbf{X} b = 0$$

Let both side $\times b^T$

$$\therefore b^T \mathbf{X}^T \mathbf{X} b = (Xb)^T Xb = \|Xb\|^2 = 0$$

$$\therefore Xb = 0$$

$\therefore b$ is in the null space of X — ①

$$\therefore \beta_{\text{mns}} = \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{y} = \mathbf{V} (\Sigma^{-1} \mathbf{U}^T \mathbf{y})$$

and first r columns of V are the base of row space of X

$\therefore \beta_{\text{mns}}$ is in the row space of X — ②

$\therefore b$ and β_{mns} are orthogonal (from ①, ②)

$$\therefore \beta_{\text{mns}}^T b = 0$$

$$\therefore \|\beta\|^2 = \|\beta_{\text{mns}} + b\|^2$$

$$= (\beta_{\text{mns}} + b)^T (\beta_{\text{mns}} + b)$$

$$= \|\beta_{\text{mns}}\|^2 + 2\beta_{\text{mns}}^T b + \|b\|^2$$

$$= \|\beta_{\text{mns}}\|^2 + \|b\|^2 \geq 0$$

$$\therefore \|\beta\|^2 \geq \|\beta_{\text{mns}}\|^2$$

$$\therefore \|\beta\| \geq \|\beta_{\text{mns}}\|$$

(c) Let $\mathbf{X}^+ = \mathbf{V} \Sigma^{-1} \mathbf{U}^T$

$$\text{i)} \mathbf{X} \mathbf{X}^T \mathbf{X} = \mathbf{U} \Sigma \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{U} \Sigma \mathbf{V}^T = \mathbf{U} \Sigma \mathbf{I}_r \Sigma^{-1} \mathbf{I}_r \Sigma \mathbf{V}^T = \mathbf{U} \Sigma \mathbf{V}^T = \mathbf{X}$$

$$\text{ii)} \mathbf{X}^T \mathbf{X} \mathbf{X}^T = \mathbf{V} \Sigma^{-1} \mathbf{U}^T \mathbf{U} \Sigma \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T = \mathbf{V} \Sigma^{-1} \mathbf{I}_r \Sigma \mathbf{I}_r \Sigma^{-1} \mathbf{U}^T = \mathbf{V} \Sigma^{-1} \mathbf{U}^T = \mathbf{X}^T$$

$$\text{iii)} (\mathbf{X} \mathbf{X}^T)^T = (\mathbf{U} \Sigma \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T)^T = \mathbf{U} (\Sigma^{-1})^T \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T = \mathbf{U} \Sigma^{-1} \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T = \mathbf{U} \Sigma^{-1} \mathbf{I}_r \Sigma \mathbf{U}^T = \mathbf{U} \mathbf{U}^T$$

$$\mathbf{X} \mathbf{X}^T = \mathbf{U} \Sigma \mathbf{V}^T \mathbf{V} \Sigma^{-1} \mathbf{U}^T = \mathbf{U} \Sigma \mathbf{I}_r \Sigma^{-1} \mathbf{U}^T = \mathbf{U} \mathbf{U}^T$$

$$\therefore (\mathbf{X} \mathbf{X}^T)^T = \mathbf{X} \mathbf{X}^T$$

$$\text{iv)} (X^T X)^T = (V \Sigma^{-1} U^T U \Sigma V^T)^T = V \Sigma U^T U \Sigma^{-1} V^T = V V^T$$

$$X^T X = V \Sigma^{-1} U^T U \Sigma V^T = V V^T$$

$$\therefore (X^T X)^T = X^T X$$

According to i)~iv), $V \Sigma^{-1} V^T$ is the pseudo-inverse of X
